Hiring Team
Stacklok
Staff Forward Deployed Engineer

Hello,

I am writing to apply for the Staff Forward Deployed Engineer role at Stacklok. I work at the intersection of applied AI engineering, customer-facing technical delivery, production software, and the systems work required when no playbook exists yet.

Enterprise AI adoption will not be solved by models alone. Organizations need secure connectivity, deployment standards, governance, observability, and infrastructure that works inside environments they already trust. Stacklok's focus on Kubernetes-native infrastructure, MCP and agent connectivity, AI gateways, and open-source foundations is the production problem I want to help define in the field.

My strongest verified evidence includes founding-engineer work on Lore Machine, Playwire Solutions Engineer and data systems work, Oolite Arts Digital Lab leadership, and rapid AI delivery through AI24 and production agentic automations. I am Miami-based, operate in U.S. Eastern Time, and am available for occasional travel.

I want to be direct about Kubernetes platform depth. Requirements around operators, CRDs, Go controllers, Helm, and GitOps are areas I would treat as an intensive technical ramp rather than overstate. What I bring on day one is production engineering judgment, cloud and container foundations, debugging discipline, AI-assisted learning, customer communication, and a habit of turning engagements into runbooks.
