

TECHNICAL EVIDENCE BRIEF

Forward-deployed proof, without overclaiming

A compact review of the code and operating evidence most relevant to Deloitte's Forward Deployed Engineer role. The through-line is discover - build - harden - enable: translate ambiguous stakeholder needs into working software, add review and reliability controls, then make the system usable by mixed technical audiences.

PRIMARY PUBLIC ARTIFACT

Agentic Evidence Pipeline

A stateful TypeScript system that ingests public or synthetic evidence, performs hybrid retrieval, produces typed assessments with citations, pauses for human review, and preserves a reviewable trail. It demonstrates delivery patterns; it is not presented as a customer production deployment or a ServiceNow implementation.

PUBLIC REFERENCE
IMPLEMENTATION -
BUILDING V0.1

CONNECT	RETRIEVE	ASSESS	REVIEW	AUDIT
fixtures + normalized records	FTS + pgvector + RRF	typed output + citation gate	approve / edit / reject	status + hashed events

CODE DELOITTE SHOULD INSPECT

<u>Stateful run + human review</u> packages/agent/src/run.ts Idempotent run creation, explicit lifecycle transitions, persisted assessment state, review pause, resume, and audit events.	<u>Citation fail-closed policy</u> packages/agent/src/policy.ts Unsupported evidence IDs lower confidence, change status to insufficient evidence, and force human review.
<u>Hybrid retrieval</u> packages/retrieval/src/search.ts Tenant- and visibility-scoped lexical and vector search combined through deterministic reciprocal rank fusion.	<u>Durable job runner</u> packages/jobs/src/runner.ts Duplicate protection, classified failures, retry backoff, dead-letter handling, and replay semantics.

Transferable delivery evidence

The evidence below separates proven experience from proposed ramp work. ServiceNow platform depth is not claimed; the value proposition is rapid learning, client translation, full-stack prototyping, and disciplined hardening.

Agentic AI implementation	Agentic Evidence Pipeline: state, retrieval, citation gates, HITL review, durable jobs, and offline eval harness.	PUBLIC REFERENCE
Client discovery + delivery	Playwire solutions engineering: scoped and troubleshoot publisher integrations; Lore Machine: converted product goals into shippable technical work.	PROVEN
Enterprise data + integration	Kinesis/Athena to Snowflake migration, Tableau tooling, Salesforce/web integrations, GraphQL, APIs, and production support.	PROVEN
Technical enablement	Designed and delivered 18 hands-on workshops for mixed-skill audiences across AI, agentic tools, media systems, and digital workflows.	PROVEN
ServiceNow platform	Proposed thin slice: scoped intake, retrieval-assisted recommendation, human approval, auditable decision record, and handoff runbook.	RAMP - NOT BUILT

ADDITIONAL PROOF

<u>Institutional Memory Agent - Infra24</u>	PROTOTYPE
TypeScript, Supabase pgvector, OpenAI, hybrid retrieval, grounding guards, and a golden-set evaluation script. Presented as prototype evidence; no production deployment claim.	
Human-in-the-loop operating workflows	PRODUCTION PATTERN
n8n and Airtable workflows demonstrate review queues, structured records, and human-controlled actions. The Deloitte page should describe the pattern precisely rather than imply a completed ServiceNow integration.	
Product delivery + enablement	PROVEN
Founding engineering work at Lore Machine moved a generative storytelling product from prototype to production on Vercel. At Oolite Arts, 18 workshops demonstrate the enablement side of forward-deployed work.	

EVIDENCE DISCIPLINE

CLAIM BOUNDARY	<u>Evidence ledger</u>
Public/synthetic fixtures only. Not customer production, not SOC 2/security certification, and no autonomous final decisions.	Verified, partial, planned, and prohibited claims are recorded explicitly.
	<u>Offline fake-provider report</u>
